Human Computer Interface - SPP7

SiteManager

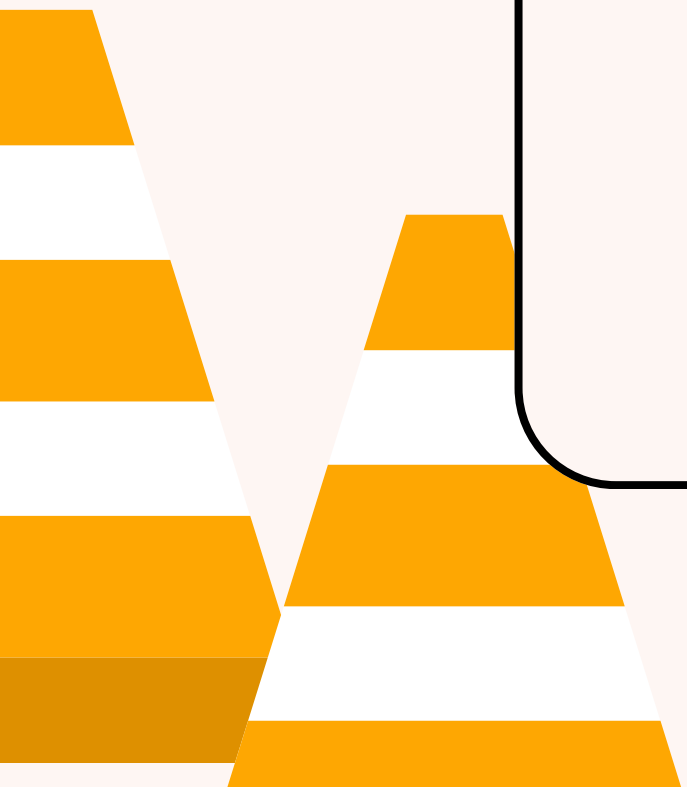

"Right people. Right equipment. Right on time."

Problem Statement

Construction companies require a digital dashboard to track all projects, employees, and equipment in one centralized location.

Solution

Our solution is to create a project application including dashboard and map that links to projects and shows exactly which employees, equipment, and materials are needed at each location.

Tools Used

- GitHub (Files and Collaboration)
- React + Vite (Front End Framework)
- Tailwind (CSS)
- JavaScript (Backend Placeholder)

JS

Design Evolution

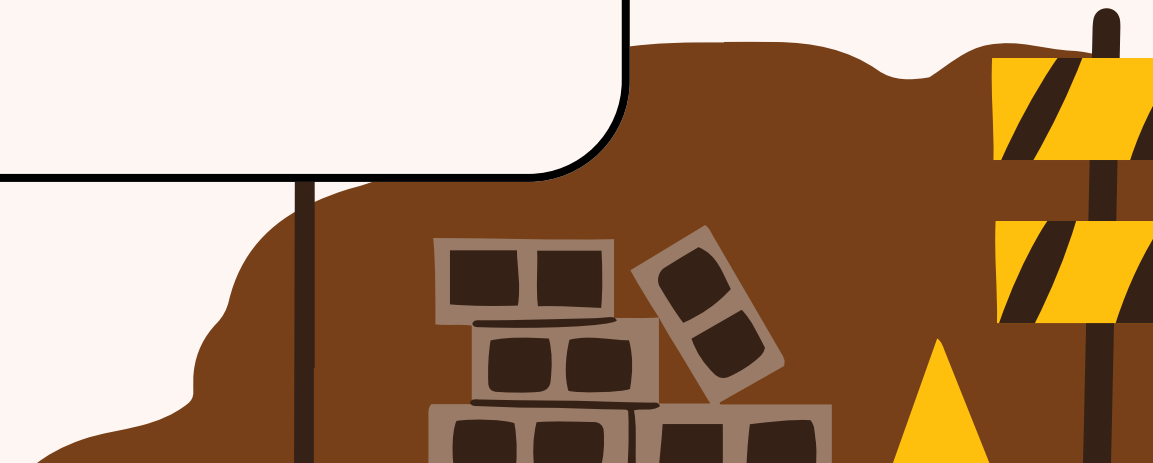

LoFi Prototype (Paper version)

MediumFi Prototype (Limited functionality and design)

HiFi Prototype (Final Version)

Key Revisions from MedFi

- Individual Project Pages
- Individual Equipment Pages
- Ability to allocate resources
- Map View
- Improved Design

Features Not Incorporated

- Authorization (Role-based privileges)
 - Manager, Foreman, Mechanic, Employee
- Notifications for employees (based on reassignment)
- Live tracking for equipment and deliveries

Three Main Tasks

Easy

Store the list of heavy equipment and their maintenance records and status, allowing the mechanic to edit as required.

Mechanic

Medium

Store the list of all ongoing projects and allow the foreman to see required equipment/materials and upload progress notes.

Foreman

Hard

Show all ongoing projects on an interactive map. Each project contains a list of assigned employees, equipment, and materials that can be edited by the manager.
